

R+H flowcoroll V system installed at Stolbud

In October 2014 the further developed impregnation system for individual parts flowcoroll V has been installed at the company Pozbud in Poland. Mainly the innovated blow-off unit as well as the new booth technique allow an easy and comfortable use of this system for the coating of individual parts with various impregnation materials.

At Stolbud the flowcoroll V has been combined with three infrared dryers and one grinding device. Due to a short drying time of approx. three minutes and after manual inspection, immediate further processing of the parts in the grinding system is possible.
